Issue 54 -- New Product Programmable Prop Amp Plug

This new product from SUN has several innovations that are a big step forward in the ease of adjustment and use in harsh environments of a traditional open loop proportional amplifier plug. Several great improvements are:

- Hand held programmer - the need to adjust tiny screws to set the typical open loop proportional valve settings is gone. By using the hand held programmer Imin, Imax, Ramp and Dither settings can be changed and stored with ease.
- Fully encapsulated enclosure – The amplifier is in a sealed enclosure that can't be opened. Two small windows allow communication with the hand held programmer by use of an infrared link.

- Amplifier and a solenoid in one unit – When purchase for SUN proportional valve cartridges this option eliminates the gasket between the amp plug and solenoid and eliminates another potential sealing area.

- The hand held programmer also has multi-meter functions built in that allow for the checking/monitoring of input power, input signal and output current. This is great for troubleshooting.

Pricing from the SUN web site for the Hand Held Controller, IR cable and Amp Plug was listed as \$437.50 US. For more info about this product take a webinar at sunhydraulics.com
